6	Implementation	5

1 Introduction

First to all notice that rwobj means "raw object(s)", indeed rwobj introduces a new mechanism to create objects like the well known C structures. The functions exported by this package are quite low level, and many important mechanisms like member protection and name resolution aren't already defined and should be introduced by intermediate packages.

2 To do

- Introduce member functions in objects and member function specifications in proxies:
- Uniform declarations for templated proxies;
- Introduce constant objects.

3 Objects and proxies

Usually an object in programming languages can be seen as a collection of variables (organized in different ways depending on the chosen language) treated as part of a single entity. Also in rwobj objects are collections of variables, called member variables, which can be retrieved from a string representing that object. Such string is the *address* of the object and act like the address of a structure in C.

An address is composed of two parts, the *module* in which variables are created and an *identifier* that identify uniquely the object inside its module. It's up to the caller that two different objects have different identifiers. The address of an object can be obtained with the \object_address function. Identifiers and module names should not contain numbers, # and _ characters in order to avoid conflicts with automatically generated addresses.

In C each object/structure has a *type* that tells the compiler how each object should be organized and instantiated in the memory. So if you need to create objects with the same structure you should first create a new **struct** entity and then create object with such type.

In rwobj objects are created from an existing object with a particular structure that holds all the needed informations to organize their variables. Such objects that can be used to instantiate new objects are calles *proxies* and the proxy object used to instantiate an object is its *generator*. In order to create new objects with a specified proxy you can use the **\object** create functions.

Since proxies are themself objects we need a proxy to instantiate user defined proxies, you can use the proxy object in the rwobj module to create you own proxy, which address is held by the \c_proxy_address_str variable. Proxies must be created from the proxy object otherwise they won't be recognized as proxies. Instead of using \object_create to create proxies you can directly use the function \proxy_create.

Once you've created you proxy object you should specify its member variables that will be created in each object initialized with such proxy. You can add a variable specification with the \proxy_push_member function. Once you've added all yor variables specifications you can use your proxy to create objects. You should never modify a proxy once you've used it to create at least one object, since these modifications won't be updated on already created objects, leading to hidden errors in subsequential code.

When you create a new variable specification with the \proxy_push_member you can notice the presence of $\langle type \rangle$ parameter. It represents the type of such variable and can be a standard type (like t1, str, int, seq, ...) or user defined types if the following functions are defined:

```
\langle type \rangle_{new:N} and c variant;
\langle type \rangle_{set_eq:NN} and cN, Nc, cc variants.
```

Every object, and so proxies too, is characterized by the following parameters:

- the *module* in which it has been created;
- the address of the proxy generator;
- a parameter saying if the object is local or global;
- a parameter saying if the object is *public* or *private*;
- zero or more member variables.

In a local/global/public/private object every member variable is declared local/global/public/private. Address of a member variable can be obtained with the \object_member_- adr function, and you can instantiate new members that haven't been specified in its generator with the function \object_new_member. members created in this way aren't described by generator proxy, so its type can't be deduced and should be always specified in functions like \object_member_adr or \object_member_use.

4 Library functions

```
\odots
                                                                                                                                                                                             \odots \object_address:nn \{\langle module \rangle\}\ \{\langle id \rangle\}
                                                                                                                                                                                             Expands to the object address.

                                    \object_member_adr:(Vnn|nnv)
                                                                                                                                                                                                                                                            \odots \
                                    \object_member_adr:nn
                                    \object_member_adr:Vn
```

Fully expands to the address of specified member variable. If type is not specified it'll be retrieved from the generator proxy, but only if member is specified in the generator.

```
\object_member_type:nn *\object_member_type:Vn *
```

```
\odots \object_member_type:nn {\langle address \rangle} {\langle member name \rangle}
```

Fully expands to the type of member $\langle member \ name \rangle$. Use this function only with member variables specified in the generator proxy, not with other member variables.

```
\object_new_member:nnn
\object_new_member:(Vnn|nnv)
```

 $\verb|\object_new_member:nnn| \{ \langle address \rangle \} \ \{ \langle member \ name \rangle \} \ \{ \langle member \ type \rangle \}$

Creates a new member variable with specified name and type. You can't retrieve the type of these variables with \object_member_type functions.

```
\object_member_use:nnn \times \object_member_use:nnn \{\address\}\ \{\member name\}\ \object_member_use:\nn \{\address\}\ \{\member name\}\ \object_member_use:\nn \times \object_member_use:\nn \obje
```

Uses the specified member variable.

Sets the value of specified member equal to the value of $\langle variable \rangle$.

```
\label{lem:code} $$ \begin{array}{lll} \hline & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & \\ & \\ & & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\
```

```
\c_proxy_address_str
```

The address of the proxy object in the rwobj module.

\object_create:nnnNN \object_create:VnnNN $\verb|\object_create:nnnNN| \{\langle proxy \ address \rangle\} \ \{\langle module \rangle\} \ \{\langle id \rangle\} \ \langle scope \rangle \ \langle visibility \rangle$

Creates an object by using the proxy at $\langle proxy \ address \rangle$ and the specified parameters.

\c_object_local_str
\c_object_global_str

Possible values for $\langle scope \rangle$ parameter.

\c_object_public_str
\c_object_private_str

Possible values for $\langle visibility \rangle$ parameter.

\object_create_set:NnnnNN \object_create_set:NVnnNN \object_create_gset:NnnnNN \object_create_gset:NVnnNN $\label{local_create_set:NnnnNN} $$ \langle str\ var \rangle $$ {\langle proxy\ address \rangle} $$ {\langle module \rangle} $$ {\langle id \rangle} $$ $$ \langle scope \rangle $$ $$ \langle visibility \rangle $$$

Creates an object and sets its fully expanded address inside $\langle str \ var \rangle$.

```
\proxy_create:nnN
\proxy_create_set:NnnN
\proxy_create_gset:NnnN
```

\proxy_push_member:nnn \proxy_push_member:Vnn

```
\proxy_push_member:nnn \ \{\langle proxy \ address \rangle\} \ \{\langle \ member \ name \ \rangle\} \ \{\langle \ member \ type \ \rangle\}
```

Updates a proxy object with a new member specification, so that every subsequential object created with this proxy will have a member variable with the specified name and type that can be retrieved with \object_member_type functions.

\object_assign:nn \object_assign:(Vn|nV|VV)

```
\verb|\object_assign:nn| \{\langle to \ address \rangle\} \ \{\langle from \ address \rangle\}|
```

Assigns the content of each variable of object at $\langle from \ address \rangle$ to each correspective variable in $\langle to \ address \rangle$. Both the objects should be created with the same proxy object and only variables listed in the proxy are assigned.

5 Examples

Example 1

Create a public proxy with id myproxy with the specification of a single member variable with name myvar and type t1, then set its address inside \l_myproxy_str.

```
\str_new:N \l_myproxy_str
\proxy_create_set:NnnN \l_myproxy_str { example }{ myproxy }
  \c_object_public_str
\proxy_push_member:Vnn \l_myproxy_str { myvar }{ tl }
```

Then create a new object with name myobj with that proxy, assign then token list \c_dollar_str{} ~ dollar ~ \c_dollar_str{} to myvar and then print it.

```
\str_new:N \l_myobj_str
\object_create_set:NVnnNN \l_myobj_str \l_myproxy_str
    { example }{ myobj } \c_object_local_str \c_object_public_str
\tl_set:cn
    {
        \object_member_adr:Vn \l_myobj_str { myvar }
    }
    { \c_dollar_str{} ~ dollar ~ \c_dollar_str{} }

Output:
    $ dollar $
```

6 Implementation

```
1 \*package\
2 \( \mathref{QQ=objpriv} \)
